

EXECUTIVE SUMMARY: ATTRITION ANALYSIS

To: Director of Human Resources | Dataset: 1,470 Employees

Overall Attrition	Highest Risk Role	Most Critical Tenure
16.1% (237 Leavers)	Sales Reps (39.8% Exit Rate)	Year 1 (59 Exits)

1. The Core Finding: Burnout Trumps Compensation

While a pay gap exists between those who stay and those who leave, our data conclusively proves that **salary is not the primary driver of resignations**. The true catalysts for employee turnover are rooted in severe lifestyle disruption and burnout. Our predictive system identified the strongest predictors of an exit:

- **Forced Overtime (#1 Driver):** Employees required to work mandatory overtime are overwhelmingly the most likely to resign. Burnout from relentless overwork outweighs management and compensation issues.
- **Frequent Business Travel:** Constant travel severely disrupts personal life and accelerates the decision to leave.
- **Demographic Agility:** Unmarried employees exhibit a significantly higher flight risk, likely due to a higher career risk tolerance and willingness to relocate or switch jobs quickly.

2. High-Priority Danger Zones

Our retention efforts are currently spread too thin. To immediately reduce attrition, HR must pivot its focus to the following critical areas:

- **Roles: Sales Representatives** (39.8% attrition) and **Laboratory Technicians** (23.9% attrition) are bleeding talent at alarming rates.
- **Tenure:** The First Year is the absolute danger zone. 59 employees resigned in Year 1—nearly triple the amount of any subsequent year. This indicates a severe breakdown in early onboarding, expectation management, or initial increments.

3. Recommended Immediate Actions

Based on the data, we recommend the following cost-effective interventions:

- **Implement an Overtime Cap Policy:** Introduce a strict corporate cap on mandatory overtime hours, or mandate a "comp-off" (compensatory time off) policy for the Sales and R&D departments. We must tackle structural burnout directly rather than treating the symptoms.
- **Launch Targeted "Stay Interviews":** Proactively schedule informal conversations (not exit interviews) for single employees in high-travel roles who are within their first 2 years at the company. Ask them what would make them stay. Uncover fixable frustrations before they decide to leave.

4. Operational Guidance for the Predictive Radar

We have developed an AI early-warning system to flag employees who exhibit the exact patterns of those who have left.

Important Note on Usage: This tool is intentionally tuned to cast a wide net so we do not miss anyone who might be considering quitting. Because of this aggressive safety net, it will occasionally generate "false alarms" by flagging employees who are actually content. *Leadership should use these predictions solely as a compass to guide supportive check-ins, never as a verdict or basis for punitive action against an individual.*
